

THE ARM AND HAND OF A BAT

One of the supposed best evidences of evolution is the fact that the bones in your arm and hand are similar to those of other mammals.

Well, for a moment, let us examine the bones in the arm and hand of the bat. Look at the illustration closely. Do the bones in the bat look similar to those in your own arm and hand?

THE "FIVE-BONE LIMB"

The fact that all land animals with backbones have the basic pattern of "five-boned" arms and legs is considered a most marvelous evidence of evolutionary theory. But this surely is not much in the way of evidence. Each species is different from each other species in thousands of different ways, and all those differences exquisitely fit its peculiar needs.
